Vellum PDF Editor

Sample document for viewing, search, annotation and page operations

This document was generated with pdf-lib. Every paragraph on these pages is real, extractable text, which makes it useful for exercising the in-document search of a PDF editor. Try searching for the word needle: it appears several times across this file, on purpose, so that next and previous match navigation has something to find.

The editor under test supports continuous scrolling, zoom, page thumbnails, rotation, deletion, reordering, blank page insertion, merging, splitting, annotations and free text. This page gives its highlight and pen tools something realistic to work on.

Quick facts

Format: PDF 1.7 · Pages: 6 · Fonts: Helvetica, Helvetica-Bold

Search needle count in this file: 6 · Generated: deterministically by script

1 Viewing and navigation

A capable reader view is the foundation of any PDF editor. Pages should render sharply at every zoom level, scroll continuously without pagination friction, and keep thumbnails in sync as the document changes. The left sidebar mirrors the page order at all times and doubles as the drag target for reordering.

Zoom controls live in the top toolbar alongside fit width and fit page. Page navigation accepts direct numeric input, and the current page indicator follows the scroll position rather than the other way around. A search needle hides in section 2.1 below; the highlight overlay should find it without disturbing the underlying text.

2.1 Text extraction

Search depends on a faithful text layer. Each line you are reading now is positioned with drawText, so pdf.js can recover every glyph. When a needle appears mid-sentence, like this needle right here, the match rectangle must cover the word and nothing else.

2 Page operations

Rotate, delete, reorder and insert: the four operations every Acrobat-class tool gets right before anything else. Rotation applies in ninety degree steps and the view follows immediately. Deleting the final page is refused. Reordering uses the thumbnail sidebar and keeps every annotation glued to its original page.

This page is a good rotation candidate: turn it sideways and the toolbar, thumbnails and annotation overlay should all agree about where the top of the page is. A needle sits on this page too, so search highlighting can be checked against rotated text as well.

> Blank pages inherit the size of the current page.

3 Merge and split

Merging appends every page of a second file to the open document. Splitting does the inverse: a page range such as 1-3, 5 becomes a brand new file while the open document stays untouched. Both flows go through pdf-lib copyPages, which carries over fonts, images and vector content.

Operation	Source	Result
Merge	Open document + picked file	Pages appended at the end
Split	Open document	New file with the chosen range
Save	Open document	Annotations flattened into the file

One more needle for the collection, tucked into section three so that match navigation crosses a page boundary when stepping through results.

4 Annotations

Highlights, freehand ink, sticky notes and rectangles live on an overlay above the rendered page while you edit. On save they are flattened: drawn into the page content stream so any other PDF viewer shows them identically. Colors and stroke widths chosen in the toolbar are baked in too.

The fifth needle hides here on page five. Highlight this sentence with the marker tool, circle the word needle with the pen, then save and reopen the file to confirm the marks became permanent.
